

FILETTE'S UNIQUENESS

Acqua Filette, one of the Italy's purest waters, originates from the source of Guarcino, at 900 meters above sea level on the green and uncontaminated Apennine Mountains in the Lazio Region.

The almost total absence of nitrates along with a low level of sodium and the best balanced amount of total dissolved solids make Acqua Filette ideal for daily use.

It is available in three different kinds: "Naturalmente naturale" (Naturally Still), "Delicatamente frizzante" (Gently Sparkling) and "Decisamente frizzante" (Strongly Sparkling), being the perfect partner to the best wines and the most exquisite dishes. Acqua Filette: three different ways to be unique.

WATER LIKE WINE

Mineral water is gradually following the same evolutionary path as wine. Water sommeliers are increasingly common figures in restaurants, and several courses teaching how to start and practice this new profession are being held.

The water list, next to the wine list, is becoming ever more common among the best restaurants in Italy and all over the world.

Acqua Filette is a multisensory pleasure. It enhances the preciousness of its contents through a balanced harmony of microelements, essential design and luxurious, elegant shapes: the classic Bordeaux bottle is wrapped in a label with an “F” made of silver foil on it.

The aesthetic sense meets the perfect taste in those places where Acqua Filette finds its natural location: the best wine houses and the top restaurants and hotels all over the world.

DRINK CONSCIOUSLY. NITRATES

Acqua Filette's organoleptic properties were already known in 1899, when, at the end of one of his scientific researches, Vittorio Davoli wrote: «Filette is much more advisable than other well-known waters, because of its low mineralization and its high delicacy and pureness». The most recent analysis conducted by La Sapienza University, in Rome, confirmed Acqua Filette's almost total absence of nitrates.

Nitrates content is the most important parameter in evaluating waters' quality as it expresses the level of their contamination.

The wide use of fertilizers in agriculture, as well as air pollution, can cause nitrates and other nitrogen compounds to penetrate into the ground, with groundwater contamination as a result.

Nitrates can prevent blood from carrying oxygen to the cells producing dangerous effects on the body. Nitrates can also combine with proteins to form compounds known as nitrosamines which can cause cancer.

Although consumers can choose waters with the right mineral salt amount relating to their personal needs, it is advisable for them to drink waters with nitrate levels as close to zero as possible.

Because of the total absence of industrial plants, fertilized fields and livestock in Guarcino Acqua Filette is one of the lowest nitrate-content mineral waters in the world.

DRINK CONSCIOUSLY. 209 MG/L, THE BEST BALANCED AMOUNT OF TDS

Total dissolved solids level indicates the amount of mineral nutrients in mineral water, which tells why it is a very important parameter to establish mineral water's lightness. Mineral waters are divided into four main categories, depending on the amount of TDS they have.

Among these categories, mineral waters with a low mineral concentration – i.e. with a TDS level between 50 and 500 mg/l – are recommended for daily use.

On the other hand, waters with a very low, intermediate or high mineral concentration should be drunk under medical advice. Acqua Filette, containing 209 mg/l of TDS, has the best balanced amount of mineral nutrients which makes it ideal for daily use.

DRINK CONSCIOUSLY. LITTLE CLUSTER, GREAT PROPERTIES

Water is not composed of single molecules, it is rather made up of clusters of molecules whose size can vary from water to water. The smaller the cluster, the lighter, more digestible and able to permeate the human tissue and organs the water is.

After several studies conducted in Italy and in other countries, especially Japan, a country always careful about quality, it was found that Acqua Filette's molecules are assembled in very reduced clusters.

THE 120 YEAR LONG STORY OF THE VENUS OF THE WATERS

The first historical account about the existence of the spring dates back to 400 B.C., proving that it was already known by the Romans. They dedicated the spring to Venus, as a connection between the goddess and the vital element of water. Today, a sculpture stands among the water streams to witness this peculiar symbolism.

The first written evidence about the spring dates back to 50 A.D. In his “De Re Rustica”, Lucius Junius Moderatus Columella, a Roman writer living at the time of Seneca, celebrated the water of Guarcino, the place where Roman legions stopped to heal the wounds they had suffered during their campaign in the East. «Est in Guarceno Campaniae fluens aqua montibus oriunda, salubritati corporis accomodatissima» (in Guarcino, Campania, there is a kind of water gushing from the nearby mountains which is highly recommended for the health of the body).

Bottled and distributed since 1894, Acqua Filette was awarded during the XX century and has become famous as a healthy and curative water. Since 1930s, it has been exported all over the world.

AN INTERNATIONAL VOCATION

Acqua Filette's international vocation is witnessed by its presence all over the world, from Europe to North America to Asia, in thirty different Countries where products are exported with the purpose of guaranteeing the highest quality, preserving the ecosystem and improving people's health.

Fonteltalia, the Acqua Filette bottling company, has been certified as operating in accordance with UNI EN ISO 9001:2008 quality system standard, the international standard helping companies to monitor the products across all stages of production.

FILETTE@HOME

Directly from the best restaurants and wine houses in the world to your table: you can easily order Acqua Filette on www.acquafilette.it. It will be delivered to your home in an elegant 750 ml glass bottle. Because real luxury means quality, always.

¹ World Health Organization indicates in 5 mg/l the maximum nitrate level allowed in both mineral and potable waters.

² Except different medical advice, mineral waters containing TDS levels between 50 and 500 mg/l are the best recommended waters for daily use.

³ Artesian water.
